

Distribution Centre: Design and installation of storage and picking system.

Storage solutions

- In addition to manufacturing Europe's largest range of plastic containers and pallets, Allibert Buckhorn also supply an extensive range of storage and handling equipment, together with the experience and expertise to solve all manner of materials handling problems.
- Racking systems are engineered with safety at the forefront of design. New systems have for many years conformed with the FEM European standard.

Copper alloy storage: 12 tonnes per level on adjustable cantilever racking

- The range of capacities available has enabled systems to be supplied that have previously been considered impossible.
- We also assist our Customers in planning the most suitable layout and provide technical back-up for loadings, fire precautions, health & safety legislation and building regulations relating to racking, shelving and mezzanine floors.

Automotive Industry: line-side gravity feed

1 Pallet Racking

Pallet racking systems designed to optimise storage space and work efficiently with existing handling equipment. Pallet racking can be installed in standard, narrow aisle, drive-through and drive-in configurations

2 Cantilever Racking

Series 240 cantilever features tapered columns and arms, for strength where it is needed most and providing greater clearance for easy access. Narrow aisle and continuous storage systems can be installed.

3 Shelving Systems

Shelving can fulfil many needs from a small storeroom to a high bay warehouse. Shelving systems, designed to optimise available storage space, include long-span, high bay, multi-tier, etc.

4 Mobile Shelving

Mounted on mobile bases which move along a floor mounted track, mobile shelving makes the best use of limited storage space.

5 Mezzanines

A simple storage platform releases ground floor space for production or further storage. Lower and upper floors can be partitioned for offices or secure storage. Multi-tier systems provide as many levels as the building height allows.

6 Live Storage

Live storage allows pallets, containers or boxes to flow down an inclined bed of rollers. This system combines great storage density with the advantage of 'first-in, first-out' stock rotation.
